Scenario: "Aura Fitness" Management System

"Aura Fitness" requires a basic database management system to track their fitness trainers and gym members.

Database Schema & Table Requirements

- **Trainers Table (trainers):**
  - trainer_id: Primary Key, Integer, Auto-increment.
  - trainer_name: Text up to 100 characters, Cannot be null.
  - specialization: Text up to 50 characters (e.g., 'Cardio', 'Strength'), Cannot be null.
- **Members Table (members):**
  - member_id: Primary Key, Integer, Auto-increment.
  - member_name: Text up to 100 characters, Cannot be null.
  - weight: Decimal number (e.g., 72.50).
  - trainer_id: Foreign Key linking the member to their assigned trainer.

Your Tasks

Write the exact SQL commands required to perform the following operations:

Task 1: Schema Setup (DDL)

1. Write the command to create a database named aura_fitness_db and select it for use.
2. Write the commands to create both the trainers and members tables. Ensure all data types, **Primary Keys**, and **Foreign Key** relationships are defined correctly according to the schema design.

Task 2: Data Population (DML)

1. Insert the following two records into the trainers table:
   - Kasun (Specialization: 'Strength')
   - Nimmi (Specialization: 'Cardio')
2. Insert the following three records into the members table, assigning them to the appropriate trainer_id based on the trainers created above:
   - Amara (Weight: 65.00)
   - Roshan (Weight: 82.30)
   - Nimal (Weight: 74.50)

Task 3: Data Retrieval & Joins (DQL)

1. Write a query using an **INNER JOIN** to display a list of all members showing their member_name and the corresponding trainer_name.
2. Write a filtered join query to display the names of only the members who are assigned to a trainer whose specialization is **'Strength'**.

Task 4: Data & Structural Modifications

1. Roshan's weight has changed to 80.00. Write the query to **UPDATE** his record.
2. The management decides to track trainer experience. Write an **ALTER** command to add a new column named experience_years (Integer) to the trainers table.

Take your time to draft these queries in a text editor or on paper. Drop your code below whenever you are ready to review and verify your answers.
